
Task 2

1. Look at this week task which is the second kind of tree transformations and, generally, this task involves 2 sub-tasks:
 - I. Scan a tree for sub-trees whose heads are determiners and replace the whole tree with a variable.
 - II. Remember the Variable=SubTree associations and include them in the result tree.

To discuss (if there is time)

Task (1): Was a step for the first kind of tree transformations, which is rules induction. **We are not there yet (right)? What's Next?**

Task (2): A step in the second kind of tree transformations, which is to make sure that words like quantifiers and negations have the right scope. One reason I know for way doing that is to help in the process of marking polarity. **What others? What's next?**
